VPS2500
The VPS2500 has a weather resistant housing designed for outdoor use and extreme environments.

The VPS includes built-in Wi-Fi to give you an easy to use monitoring system for your home, ranch, lake house or other weekend getaway.

For peace of mind away from home, the VPS streams images to any computer or mobile handset with internet access, anywhere in the world. You can be notified of activity via email or text message. Alerts can also be sent on loss of camera feed.

The VPS System incorporates a masking feature to eliminate data capture of moving trees or flags etc. The system only monitors for motion outside of any masked areas. Once motion is detected, recording begins. For extra security, the VPS can record before and after the motion event to ensure you capture everything (this feature can be turned on or off).

VPS (ViewPoint Server) Video Surveillance

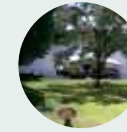

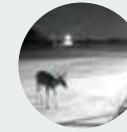

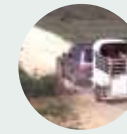

Much more than just video capture. Options are available to monitor activities such as a gate, water level in a trough or the temperature of a room. There are many monitoring options available, contact us with your specific needs.

To monitor activity via the internet, the VPS has a *built-in web server*. In areas with limited internet coverage, it can be equipped with a cellular or satellite modem or other wireless devices to monitor and transmit images.

The ViewPoint Server System manages up to 4 cameras independently and monitors remote locations like barns, boat houses, and gates. Cameras communicate directly or wirelessly to the centrally located VPS for all image processing.

Once motion is detected, recording begins.

VPS1500
The ViewPoint Server System manages up to 4 cameras independently.

CompuSys Computer Services Inc., is licensed by the Texas Private Security Board (B15935). We specialize in video surveillance systems to meet your needs. Let VPS give you the power to monitor your home or "Weekend Get-away"! Enjoy peace of mind, order your VPS System today!
